CROP-REPORTING DISTRICTS

CORN PRODUCTION IN IOWA, 1928-1939 INCLUSIVE

- By Counties -

Trends in corn production in Iowa during the 12 years ending in 1939 were influenced by four important factors; namely, low prices, acreage adjustments, drought and the introduction of hybrid seed. From the early twenties, Iowa farmers attempted to maintain their income by increasing their corn production. As a consequence, the total acreage of corn planted during the years 1928-1932 was the largest for any 5-year period on record. At the same time, corn prices were following a general declining trend.

Following the low-price-high-acreage era of 1930-1933, the Iowa corn acreage was lowered through the combined forces of drought in the years 1934 and 1936, and the participation of Iowa corn growers in programs of the Agricultural Adjustment Administration. Corn acreage planted reached a record high of 11,849,000 acres in 1932. Since that time, the acreage has been adjusted by varying percentages until in 1939 the estimate was placed at 9,506,000 acres, or a decline of 19.8 percent from the high of 1932.

In 1934 and again in 1936, unfavorable weather greatly reduced corn yields in much of the State. Districts 1, 2, and 3, comprising the northern third of the State, escaped serious injury in 1934 but all districts were affected in 1936.

The rapid increase in the use of hybrid seed corn since 1937 has been a major influence in increasing average yields per acre. In addition, the acreage control programs have removed from corn production some of the less fertile land. These factors in addition to exceptionally favorable weather conditions in 1938 and 1939 resulted in new record average yields per acre of harvested corn. If such factors continue, the average yields during the next decade may be expected to be on a higher level than than during the years of 1928-1939, inclusive.

For the 12-year period 1928-1939, Iowa accounted for 17.4 percent of the total United States corn production and 24.1 percent of the production in the North Central States. The percentages changed from 17.2 to 17.6 and from 23.0 to 24.9, respectively, from the first 5 years of the period to the last 5 years. Thus while the importance of Iowa in the National corn production picture changed little, it gained 2 percent in the total for the North Central States.

The data in this bulletin are presented to meet the demands of State, Federal and County agencies, educational institutions and the general public for a series of annual statistics, by counties, on acreage, yield per acre and production of corn in Iowa. The Agricultural Marketing Service of the United States Department of Agriculture and the Division of Agricultural Statistics of the Iowa Department of Agriculture have cooperated in assembling the material.

These county data are estimates based upon the best information available through the United States Census, the Iowa annual farm Census by Assessors, county data furnished to the Agricultural Adjustment Administration by producers, and upon sample survey data supplied by crop reporters. County data are not ordinarily available currently until after January 1, following the crop production season, when the Iowa annual farm Census taken by the township assessors has been compiled.
